

# Media Queries

Below is a screenshot of a website at three different screen sizes (less than 600px wide, between 600 - 900px wide, and larger than 900px wide). The starter code has all the HTML for the page, but the CSS contains only the selectors, and no properties. Your job is to put the CSS from `missing-css.txt` in the correct places in `styles.css` in order to make your page look the same as pictured below, at the different screen sizes.

Note: some selectors have multiple properties. The groups of properties are separated by empty lines.

For example, for the styles on the right: the 1st line goes with one selector, and the 3rd and 4th lines both go with the same selector.

```
margin: 5px;
```

```
width: calc(100% / 4 - 10px);  
height: 200px;
```
