

Responsive Design with Media Queries

What is responsive design?

Responsive Design is an approach to web design where web pages respond to varying screen sizes.

As a user switches from their phone to their laptop, the website should automatically switch to accommodate the different screen size and device.

Media Queries

Media Queries are a technique we can use in CSS. We use the @media rule to include blocks of CSS properties, only if our specified condition is true.

Screens that are 500px wide or above:

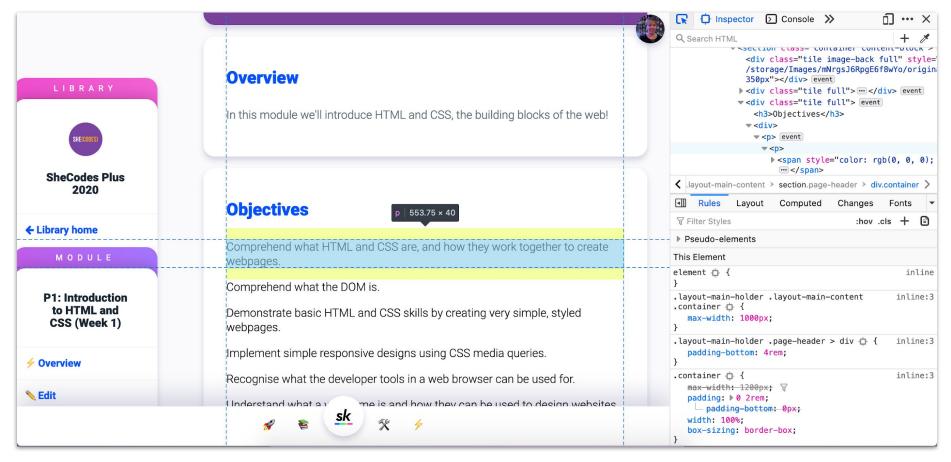

```
@media (min-width: 500px) {
    /* some styles */
}
```

Screens that are 500px wide and below:

```
@media (max-width: 500px) {
    /* some styles */
}
```

Writing Media Queries

Open introduction-to-media-queries in your code editor, then open index.html in a web browser.

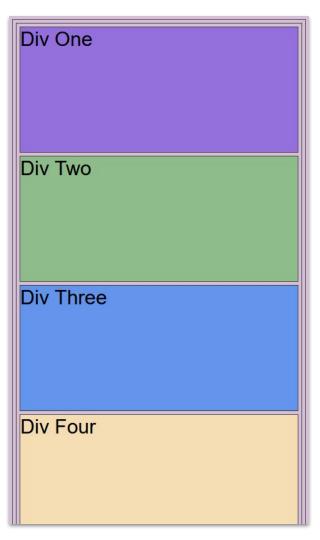

No matter the size of the screen, you'll see a layout of 4 divs layered one above the other.

Let's adapt this so for screens 500px wide or larger, we see two divs per row.

Add the following to styles.css:

```
@media (min-width: 500px) {
    div {
        display: inline-block;
        width: 44%;
    }
}
```

✓ Refresh your browser and see what changed!

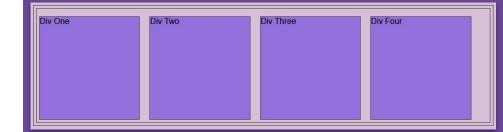

Add another media query to show 4 divs in one row for screens of 900px wide and above.

Change the font size at each breakpoint.

Change the colour of the divs so each row has the some colour divs at each breakpoint.

Media Queries are a technique we can use in CSS. We use the @media rule to include blocks of CSS properties, only if our specified condition is true.

Screens that are 500px wide and below:

```
@media (max-width: 500px) {
    /* some styles */
}
```

Try changing the media queries from min to max queries, and order them largest to smallest.
